

Liliana Cimino

Date of Birth: February 03, 1995

Report Date: February 25, 2026

A full-page background image of a woman with long brown hair in a ponytail, wearing a white visor, sunglasses, and athletic gear (a black, yellow, and orange long-sleeved top with blue leggings). She is running on a paved path next to a body of water, with a city skyline and trees in the background. The text "A Book About You" is overlaid in large white font at the bottom.

Your Longevity Status

Executive Summary

Leading biomarkers

This evaluation is more than just numbers; it's about understanding how these key physical elements interplay and impact your overall health. The goal is to provide you with clear insights into what these biomarkers mean for you, offering a roadmap to optimize your well-being and longevity.

Bio Ages

Most Relevant Risks

We pinpoint key health risks by analyzing your vital metrics, establishing a personalized health baseline for effective monitoring and tailored medical assessments.

General Health 85.00 % →

Pace of Aging shows whether your body is aging faster or slower than expected for someone your age. A value of 100% means your biological and actual age are in sync. Below 100% means your body appears younger than your years — a positive sign. Above 100% suggests your body is aging ahead of pace, which can help guide your next health steps.

Metabolic Health 4.00 % →

The risk assessment estimates the member's likelihood of developing diabetes over the next 10 years. It is based on validated clinical risk models and produces a personalized risk estimate. Results should be interpreted in the context of the member's overall clinical profile. Additionally, your member's personalized risk score is 2/9 (low), Based on the ADA (American Diabetes Association) risk test.

Heart Health 0.78 % →

The risk assessment estimates the member's likelihood of developing cardiovascular disease over the next 10 years. It is validated for individuals aged 30 to 74 who are free of cardiovascular disease. Results may be inaccurate or may overestimate risk for other populations.

Brain Health 0.00 % →

The risk assessment estimates the member's likelihood of developing dementia based on demographic, clinical, and lifestyle factors. It supports clinical decision-making and should be interpreted in the context of the member's overall clinical profile.

Kidney Health 0.00 % →

The risk assessment estimates the member's likelihood of developing chronic kidney disease over the next 10 years, based on clinical and laboratory parameters. It supports clinical decision-making and should be interpreted in the context of the member's overall clinical profile.

Your Longevity Plan

Personalized Plan

These suggested interventions are specifically tailored for you to take proactive steps on your path to longevity. Each one is designed to have a significant impact, adding to your arsenal of healthy habits. With these personalized recommendations from your doctor, you have the power to positively influence your body's aging process and change the trend towards a healthier, longer life.

Activity

Resistance Training

 Activity

Resistance training involves exercises that build muscle strength and mass using weights or body weight

Why

With your elevated Fat% of 34.6% and BMI of 26.3, resistance training can help improve body composition by increasing muscle mass and reducing body fat

Tips

Start with 2-3 sessions per week, focusing on major muscle groups. Begin with bodyweight exercises and gradually progress to weights as you build strength

Sleep

Sleep Environment Optimization

 Sleep

Creating an optimal sleep environment helps improve sleep quality and immune function

Why

Quality sleep is crucial for immune system balance, which can help address your elevated Neutrophils and low Lymphocytes

Tips

Keep your bedroom cool, dark, and quiet. Remove electronic devices and maintain a consistent sleep schedule

Nutrition

Add Whey Protein On a Daily Basis

 Nutrition

Whey protein is a high-quality protein supplement that supports muscle growth and maintenance

Why

Adding whey protein can help improve your body composition by supporting muscle growth while helping to reduce body fat percentage

Tips

Consume 20-30g of whey protein daily, ideally after resistance training sessions or as part of your breakfast

Meditation

 Mind

Meditation is a mind-body practice that helps reduce stress and improve immune function

Why

Your low Lymphocytes% (13%) and high Neutrophils% (80%) suggest immune system stress. Meditation can help balance immune function through stress reduction

Tips

Start with 10 minutes daily, preferably in the morning or before bed, using guided meditation apps or videos

Medical History Summary

Health Goals

You want to improve Fitness and Nutrition.

Employment

project manager.

Medical History

You have no record of medical history.

Medication(s)

You have no record of medications.

Social History

You have completed Bachelor's Degree or higher.

You don't smoke.

You sleep from 9:45 PM to 5:30 AM during the workweek and from 10:45 PM to 9:30 AM during the weekend.

You don't consume alcoholic beverages.

Your stress level is 4 out of 5 (1 – low, 5 – high).

Family History

You have Cancer, Diabetes Type 2, Hypertension (High Blood Pressure) in your family.

Level of Activity

You are Highly active (Work demands high activity).

You have a consistent exercise routine, achieving more than 150 minutes of resistance training and 150 minutes of aerobic exercise per week.

You enjoy Bodybuilding, Full Body Strength, Full Body Workout, Leg Press, Lunges, Mobility Training, Paddle Board, Pilates, Squats, Swimming, Yoga.

Nutrition/Diet

You are eating 2 servings of vegetables and 2 servings of fruit in a typical day.

Allergy History

You are allergic to Milk.

Health Journey

Fat%

Body fat percentage indicates the proportion of fat in your body.

Total Cholesterol

The sum of all cholesterol in the blood, including LDL, HDL, and other lipid components, used to assess heart disease risk.

Low-density Lipoprotein (LDL)

Low-density lipoprotein, often referred to as "bad" cholesterol, can build up in artery walls and increase the risk of heart disease.

Triglycerides

A type of fat found in the blood that stores unused calories and provides energy, high levels of which can increase the risk of heart disease.

Where to Focus Your Health Efforts

Diabetes

⇒ Clinically verified • 12 parameters • 10 year risk

4% →

Diabetes is a significant health condition influenced by various factors, including blood glucose levels, body mass index (BMI), family history, lifestyle choices, and the presence of hypertension. As individuals age, the risk of developing diabetes increases, especially if blood glucose levels rise from normal to prediabetes or diabetes stages. A higher BMI further elevates the risk of type 2 diabetes, while a family history of the condition can predispose individuals to it. Lifestyle factors, such as diet and physical activity, also play a crucial role in mitigating these risks.

Diabetes Trend

Cardiovascular

0.78% →

↔ Clinically verified • 8 parameters • 10 year risk

Cardiovascular health is closely linked to various risk factors that tend to become more significant with age, such as blood pressure, cholesterol levels, smoking habits, and the presence of diabetes. High blood pressure and elevated LDL cholesterol are key contributors to the development of coronary heart disease, a major cause of health complications. Smoking further exacerbates these risks, while diabetes adds another layer of concern for cardiovascular health. Understanding and monitoring these factors is crucial in assessing the risk of heart disease.

Dementia

⇒ Clinically verified • 12 parameters • 10 year risk

0% →

Dementia is an umbrella term for several diseases affecting memory, other cognitive abilities, and behavior. It is a complex condition influenced by various factors, including cognitive function, lifestyle choices, genetic predispositions, and existing health conditions like cardiovascular disease. The risks increase with age, as cognitive abilities such as memory, attention, and problem-solving can decline. Lifestyle choices—such as diet, physical activity, and social engagement—play a significant role in either mitigating or exacerbating these risks. Additionally, genetic factors and underlying health conditions can predispose individuals to a higher risk of dementia.
